Road Infrastructures

Studying, constructing and operating road concessions in Portugal are some of the well-established experiences listed in ELEVO Group's curriculum, the result of its participations in various concessionaires. A curriculum filled with granular bases in crushed materials, with concrete in road works of art and bituminous concrete, with many earthworks, with bridges, with viaducts...

But it is also a profound knowledge of the production of bituminous concrete aggregates that enables the ELEVO Group to be in the forefront of innovative solutions for the rehabilitation of road surfaces. In Portugal, the Group's forefront position in terms of the introduction of bituminous mixtures with recycled rubber and cold-technology bituminous products assumes particular importance.

And because our environmental commitment is a serious concern, the ELEVO Group has endeavoured to produce bituminous mixtures

incorporating approximately 50% in milled materials, reducing and rationalising the waste in construction and thereby also reducing the costs for the country.

Forming part of the history of this group are the names of the projects in which it participated and which helped build this vast curriculum in road infrastructure.

Vasco da Gama Bridge

Junction in Carregado

Bridge River Keve

Huambo - Alta Hama Road

Bailundo - Mungo Road

Asphalting of the Assomada / Tarrafal Road

Restoration BR 262 MG - Crema 1st stage
